- Train and Test Data Split
- Train Logistic Regression, KNN, Decision Tree, SVM, and Linear Regression models and return their appropriate accuracy scores

Estimated Time Needed: 180 min

Instructions

In this notebook, you will practice all the classification algorithms that we have learned in this course.

Below, is where we are going to use the classification algorithms to create a model based on our training data and evaluate our testing data using evaluation metrics learned in the course.

We will use some of the algorithms taught in the course, specifically:

- 1. Linear Regression
- 2. KNN
- 3. Decision Trees
- 4. Logistic Regression
- 5. SVM

We will evaluate our models using:

- 1. Accuracy Score
- 2. Jaccard Index
- 3. F1-Score
- 4. LogLoss
- 5. Mean Absolute Error

- 6. Mean Squared Error
- 7. R2-Score

Finally, you will use your models to generate the report at the end.

About The Dataset

The original source of the data is Australian Government's Bureau of Meteorology and the latest data can be gathered from http://www.bom.gov.au/climate/dwo/.

The dataset to be used has extra columns like 'RainToday' and our target is 'RainTomorrow', which was gathered from the Rattle at

https://bitbucket.org/kayontoga/rattle/src/master/data/weatherAUS.RData

This dataset contains observations of weather metrics for each day from 2008 to 2017. The **weatherAUS.csv** dataset includes the following fields:

| Field | Description | Unit | Туре |
|---------------|---|-----------------|--------|
| Date | Date of the Observation in YYYY-MM-DD | Date | object |
| Location | Location of the Observation | Location | object |
| MinTemp | Minimum temperature | Celsius | float |
| MaxTemp | Maximum temperature | Celsius | float |
| Rainfall | Amount of rainfall | Millimeters | float |
| Evaporation | Amount of evaporation | Millimeters | float |
| Sunshine | Amount of bright sunshine | hours | float |
| WindGustDir | Direction of the strongest gust | Compass Points | object |
| WindGustSpeed | Speed of the strongest gust | Kilometers/Hour | object |
| WindDir9am | Wind direction averaged of 10 minutes prior to 9am | Compass Points | object |
| WindDir3pm | Wind direction averaged of 10 minutes prior to 3pm | Compass Points | object |
| WindSpeed9am | Wind speed averaged of 10 minutes prior to 9am | Kilometers/Hour | float |
| WindSpeed3pm | Wind speed averaged of 10 minutes prior to 3pm | Kilometers/Hour | float |
| Humidity9am | Humidity at 9am | Percent | float |
| Humidity3pm | Humidity at 3pm | Percent | float |
| Pressure9am | Atmospheric pressure reduced to mean sea level at 9am | Hectopascal | float |
| Pressure3pm | Atmospheric pressure reduced to mean sea level at 3pm | Hectopascal | float |
| Cloud9am | Fraction of the sky obscured by cloud at 9am | Eights | float |
| Cloud3pm | Fraction of the sky obscured by cloud at 3pm | Eights | float |
| Temp9am | Temperature at 9am | Celsius | float |
| Temp3pm | Temperature at 3pm | Celsius | float |
| | | | |

| Field | Description | Unit | Туре |
|--------------|---------------------------|--------|--------|
| RainToday | If there was rain today | Yes/No | object |
| RainTomorrow | If there is rain tomorrow | Yes/No | float |

Column definitions were gathered from http://www.bom.gov.au/climate/dwo/IDCJDW0000.shtml

Import the required libraries

```
In [48]:
          # All Libraries required for this lab are listed below. The libraries pre-installed on
          # !mamba install -qy pandas==1.3.4 numpy==1.21.4 seaborn==0.9.0 matplotlib==3.5.0 sciki
          # Note: If your environment doesn't support "!mamba install", use "!pip install"
 In [1]:
          # Surpress warnings:
          def warn(*args, **kwargs):
              pass
          import warnings
          warnings.warn = warn
In [2]:
          import pandas as pd
          from sklearn.linear_model import LogisticRegression
          from sklearn.linear_model import LinearRegression
          from sklearn import preprocessing
          import numpy as np
          from sklearn.neighbors import KNeighborsClassifier
          from sklearn.model_selection import train_test_split
          from sklearn.neighbors import KNeighborsClassifier
          from sklearn.tree import DecisionTreeClassifier
          from sklearn import svm
          from sklearn.metrics import jaccard_score
          from sklearn.metrics import f1_score
          from sklearn.metrics import log loss
          from sklearn.metrics import confusion matrix, accuracy score
          import sklearn.metrics as metrics
```

Importing the Dataset

```
In [6]: df = pd.read_csv("Weather_Data.csv")
```

Note: This version of the lab is designed for JupyterLite, which necessitates downloading the dataset to the interface. However, when working with the downloaded version of this notebook on your local machines (Jupyter Anaconda), you can simply **skip the steps above of "Importing the Dataset"** and use the URL directly in the pandas.read_csv() function. You can uncomment and run the statements in the cell below.

```
In [7]: #filepath = "https://cf-courses-data.s3.us.cloud-object-storage.appdomain.cloud/IBMDeve
#df = pd.read_csv(filepath)
In [8]: df.head()
```

| Out[8]: | | Date | MinTemp | MaxTemp | Rainfall | Evaporation | Sunshine | WindGustDir | WindGustSpeed | Windl |
|---------|---|----------|---------|---------|----------|-------------|----------|-------------|---------------|-------|
| | 0 | 2/1/2008 | 19.5 | 22.4 | 15.6 | 6.2 | 0.0 | W | 41 | |
| | 1 | 2/2/2008 | 19.5 | 25.6 | 6.0 | 3.4 | 2.7 | W | 41 | |
| | 2 | 2/3/2008 | 21.6 | 24.5 | 6.6 | 2.4 | 0.1 | W | 41 | |
| | 3 | 2/4/2008 | 20.2 | 22.8 | 18.8 | 2.2 | 0.0 | W | 41 | |
| | 4 | 2/5/2008 | 19.7 | 25.7 | 77.4 | 4.8 | 0.0 | W | 41 | |

5 rows × 22 columns

Data Preprocessing

One Hot Encoding

First, we need to perform one hot encoding to convert categorical variables to binary variables.

```
In [9]: df_sydney_processed = pd.get_dummies(data=df, columns=['RainToday', 'WindGustDir', 'WindGustDir',
```

| Out[10]: | | Date | MinTemp | MaxTemp | Rainfall | Evaporation | Sunshine | WindGustSpeed | WindSpeed9am | Wi |
|----------|---|----------|---------|---------|----------|-------------|----------|---------------|--------------|----|
| | 0 | 2/1/2008 | 19.5 | 22.4 | 15.6 | 6.2 | 0.0 | 41 | 17 | |
| | 1 | 2/2/2008 | 19.5 | 25.6 | 6.0 | 3.4 | 2.7 | 41 | 9 | |
| | 2 | 2/3/2008 | 21.6 | 24.5 | 6.6 | 2.4 | 0.1 | 41 | 17 | |
| | 3 | 2/4/2008 | 20.2 | 22.8 | 18.8 | 2.2 | 0.0 | 41 | 22 | |
| | 4 | 2/5/2008 | 19.7 | 25.7 | 77.4 | 4.8 | 0.0 | 41 | 11 | |

5 rows × 68 columns

Next, we replace the values of the 'RainTomorrow' column changing them from a categorical column to a binary column. We do not use the get_dummies method because we would end up with two columns for 'RainTomorrow' and we do not want, since 'RainTomorrow' is our target.

| In [15]: | d | df_sydney_processed.replace(['No', 'Yes'], [0,1], inplace=True) | | | | | | | | | | |
|----------|----------------------------|---|---------|---------|----------|-------------|----------|---------------|--------------|----|--|--|
| In [16]: | df_sydney_processed.head() | | | | | | | | | | | |
| Out[16]: | | Date | MinTemp | MaxTemp | Rainfall | Evaporation | Sunshine | WindGustSpeed | WindSpeed9am | Wi | | |
| | 0 | 2/1/2008 | 19.5 | 22.4 | 15.6 | 6.2 | 0.0 | 41 | 17 | | | |
| | 1 | 2/2/2008 | 19.5 | 25.6 | 6.0 | 3.4 | 2.7 | 41 | 9 | | | |
| | 2 | 2/3/2008 | 21.6 | 24.5 | 6.6 | 2.4 | 0.1 | 41 | 17 | | | |
| | 3 | 2/4/2008 | 20.2 | 22.8 | 18.8 | 2.2 | 0.0 | 41 | 22 | | | |
| | 4 | 2/5/2008 | 19.7 | 25.7 | 77.4 | 4.8 | 0.0 | 41 | 11 | | | |

5 rows × 68 columns

Training Data and Test Data

Now, we set our 'features' or x values and our Y or target variable.

```
In [17]:
          df_sydney_processed.drop('Date',axis=1,inplace=True)
In [18]:
          df_sydney_processed.head()
Out[18]
```

| t[18]: | | MinTemp | MaxTemp | Rainfall | Evaporation | Sunshine | WindGustSpeed | WindSpeed9am | WindSpeed3r |
|--------|---|---------|---------|----------|-------------|----------|---------------|--------------|-------------|
| | 0 | 19.5 | 22.4 | 15.6 | 6.2 | 0.0 | 41 | 17 | |
| | 1 | 19.5 | 25.6 | 6.0 | 3.4 | 2.7 | 41 | 9 | |
| | 2 | 21.6 | 24.5 | 6.6 | 2.4 | 0.1 | 41 | 17 | |
| | 3 | 20.2 | 22.8 | 18.8 | 2.2 | 0.0 | 41 | 22 | |
| | 4 | 19.7 | 25.7 | 77.4 | 4.8 | 0.0 | 41 | 11 | |

5 rows × 67 columns

```
In [19]:
          df_sydney_processed = df_sydney_processed.astype(float)
In [20]:
          df_sydney_processed.head()
```

MinTemp MaxTemp Rainfall Evaporation Sunshine WindGustSpeed WindSpeed9am WindSpeed3r

Linear Regression

Q1) Use the train_test_split function to split the features and Y dataframes with a test_size of 0.2 and the random_state set to 10.

```

```

from sklearn.model_selection import train_test_split
X_train, X_test, y_train, y_test = train_test_split(X, Y, test_size=0.2, random_state=1
print ('Train set:', X_train.shape, y_train.shape)
print ('Test set:', X_test.shape, y_test.shape)

Train set: (2616, 66) (2616,) Test set: (655, 66) (655,)

Q2) Create and train a Linear Regression model called LinearReg using the training data (x_train, y_train).

Q3) Now use the predict method on the testing data (x_test) and save it to the array predictions.

Out[51]: array([0.09828844, 0.25850573, 0.98442736, 0.29054918, 0.14348497])

Q4) Using the predictions and the y_test dataframe calculate the value for each metric using the appropriate function.

Q5) Show the MAE, MSE, and R2 in a tabular format using data frame for the linear model.

```
In [101...
            metrics_df = pd.DataFrame({
                'Metric': ['Mean Absolute Error (MAE)', 'Mean Squared Error (MSE)', 'R2 Score'],
                'Value': [MAE, MSE, R2]
            })
In [102...
            Report = metrics df
            print(Report)
                                                                          Value
                                  Metric
           0 Mean Absolute Error (MAE)
                                                     Mean absolute error: 0.26
               Mean Squared Error (MSE) Residual sum of squares (MSE): 0.12
           2
                                R<sup>2</sup> Score
                                                                 R2-score: 0.43
```

KNN

Q6) Create and train a KNN model called KNN using the training data (x_train, y train) with the n neighbors parameter set to 4.

Q7) Now use the predict method on the testing data (x_test) and save it to the array predictions.

Q8) Using the predictions and the y_test dataframe calculate the value for each metric using the appropriate function.

```
In [71]:
    KNN_Accuracy_Score = accuracy_score(y_test, predictions)
    KNN_JaccardIndex = jaccard_score(y_test, predictions)
    KNN_F1_Score = f1_score(y_test, predictions)

In [81]:
    KNN_df = pd.DataFrame({
        'Metric': ['KNN_Accuracy_Score', 'KNN_JaccardIndex', 'KNN_F1_Score'],
        'Value': [KNN_Accuracy_Score, KNN_JaccardIndex, KNN_F1_Score]
})
```

```
print(KNN_df)

Metric Value

0 KNN_Accuracy_Score 0.760305

1 KNN_JaccardIndex 0.241546

2 KNN_F1_Score 0.389105
```

Decision Tree

Q9) Create and train a Decision Tree model called Tree using the training data (x_{train} , y_{train}).

```
In [82]: Tree = DecisionTreeClassifier(criterion="entropy", max_depth = 4)
```

Q10) Now use the predict method on the testing data (x_test) and save it to the array predictions.

Q11) Using the predictions and the y_test dataframe calculate the value for each metric using the appropriate function.

```
In [85]:
          Tree_Accuracy_Score = accuracy_score(y_test, predictions)
          Tree_JaccardIndex = jaccard_score(y_test, predictions)
          Tree_F1_Score = f1_score(y_test, predictions)
In [86]:
          Tree_df = pd.DataFrame({
              'Metric': ['Tree_Accuracy_Score', 'Tree_JaccardIndex', 'Tree_F1_Score'],
              'Value': [Tree_Accuracy_Score, Tree_JaccardIndex, Tree_F1_Score]
          })
          print(Tree_df)
                         Metric
                                    Value
           Tree Accuracy Score 0.818321
              Tree JaccardIndex 0.480349
         2
                  Tree_F1_Score 0.648968
```

Logistic Regression

Q12) Use the train_test_split function to split the features and Y dataframes with a test size of 0.2 and the random state set to 1.

```
In [88]:
    X_train, X_test, y_train, y_test = train_test_split(X, Y, test_size=0.2, random_state=1
    print ('Train set:', X_train.shape, y_train.shape)
    print ('Test set:', X_test.shape, y_test.shape)

Train set: (2616, 66) (2616,)
    Test set: (655, 66) (655,)
```

Q13) Create and train a LogisticRegression model called LR using the training data (x_train, y_train) with the solver parameter set to liblinear.

```
In [89]: LR = LogisticRegression(C=0.01, solver='liblinear').fit(X_train,y_train)
```

Q14) Now, use the predict and predict_proba methods on the testing data (x_test) and save it as 2 arrays predictions and predict_proba.

```
In [90]: predictions = LR.predict(X_test)
In [91]: predict_proba = LR.predict_proba(X_test)
```

Q15) Using the predictions, predict_proba and the y_test dataframe calculate the value for each metric using the appropriate function.

```
In [93]:
          LR_Accuracy_Score = accuracy_score(y_test, predictions)
          LR JaccardIndex = jaccard score(y test, predictions)
          LR_F1_Score = f1_score(y_test, predictions)
          LR_Log_Loss = log_loss(y_test, predictions)
In [94]:
          LR_df = pd.DataFrame({
              'Metric': ['LR_Accuracy_Score', 'LR_JaccardIndex', 'LR_F1_Score', 'LR_Log_Loss'],
              'Value': [LR_Accuracy_Score, LR_JaccardIndex, LR_F1_Score, LR_Log_Loss]
          })
          print(LR df)
                                  Value
                       Metric
         0 LR_Accuracy_Score 0.825954
              LR JaccardIndex 0.502183
         2
                  LR_F1_Score 0.668605
                  LR Log Loss 6.273247
         3
```

SVM

Q16) Create and train a SVM model called SVM using the training data (x_train, y_train).

```
In [95]: SVM = svm.SVC(kernel='rbf')
```

Q17) Now use the predict method on the testing data (x_test) and save it to the array predictions.

Q18) Using the predictions and the y_test dataframe calculate the value for each metric using the appropriate function.

Report

Q19) Show the Accuracy, Jaccard Index, F1-Score and LogLoss in a tabular format using data frame for all of the above models.

*LogLoss is only for Logistic Regression Model

Mean absolute error: 0.26

Mean Squared Error (MSE) Residual sum of squares (MSE): 0.12

0 Mean Absolute Error (MAE)

| | Metric | Value |
|----|----------------------|----------------|
| 2 | R ² Score | R2-score: 0.43 |
| 3 | KNN_Accuracy_Score | 0.760305 |
| 4 | KNN_JaccardIndex | 0.241546 |
| 5 | KNN_F1_Score | 0.389105 |

| 14 | SVM_JaccardIndex | 0.466667 |
| 15 | SVM_F1_Score | 0.636364 |

How to submit

Once you complete your notebook you will have to share it. You can download the notebook by navigating to "File" and clicking on "Download" button.

This will save the (.ipynb) file on your computer. Once saved, you can upload this file in the "My Submission" tab, of the "Peer-graded Assignment" section.

About the Authors:

Joseph Santarcangelo has a PhD in Electrical Engineering, his research focused on using machine learning, signal processing, and computer vision to determine how videos impact human cognition. Joseph has been working for IBM since he completed his PhD.
